

Anointed Application Review

Date: 4 September 2026

Scope: Engineering completeness, launch readiness, UX gaps, missing features, and recommended improvements for the Bible character quiz app (kids 6-12).

Overall Assessment

The engineering scaffold is in good shape: all 10 critical user flows are wired (auth, consent, map, gameplay, leaderboard, IAP, practice, profile). Backend tests pass and the Parchment Codex map is the active design.

The app is NOT launch-ready yet. The biggest gaps are content, legal, store assets, and real-device QA - not missing screens.

1. Must Change Before Launch

1.1 Content (biggest blocker)

- Target: 100 levels x ~20 questions (~2,000 total)
- Today: dev seed content (~2,100 auto-generated questions) and a 5-level / 60-question offline practice pack
- Action: Author and publish real questions via /admin. Do not ship seed script output as final content.

1.2 Legal and COPPA

- Privacy Policy and Terms are draft HTML only - need counsel review and live URLs
- Parental consent (VPC) email/web copy is draft - needs legal sign-off
- AdMob production settings need a COPPA audit before live ads (docs/admob_coppa_checklist.md)

1.3 Store identity

- Bundle ID mismatch: requirements say com.anointed.app; app uses com.anointed.anointed
- App icon, splash, and screenshots still placeholders

1.4 QA on real devices

- Backend: ~95 automated tests
- Mobile: essentially no automated tests; full manual test plan not executed
- Deploy/install issues suggest QA should be part of every release

1.5 IAP hardening (medium priority)

- Purchase flow works, but App Store Server Notifications V2 (refunds/revocations) is not implemented

2. UX and Polish Worth Fixing

- Visual consistency: Map uses Parchment Codex; Leaderboard, Practice, Profile still use older arcade styling
- Dead code: Stained Glass map widgets (stained_glass_*.dart) are unused
- Splash / brand: Material icon placeholder instead of final wordmark
- Level complete: Static trophy; design spec calls for celebration animation
- image_clue: UI exists but shows alt-text placeholders - no real character images
- Kids 6-12: No read-aloud/TTS for question text
- FAQ / support copy: Functional but placeholder wording
- Phone recovery: New device + phone sign-in is weak; users may need support

3. Features From Spec Not Fully Built

- Launch content bank (2,000 curated questions)
- Adaptive difficulty - performance data collected but never used
- image_clue with real assets - deferred post-launch
- Tamil localization - infrastructure exists, no translations
- Church/group leaderboards - only global leaderboard exists
- Firebase Crashlytics - optional; not configured in repo

4. New Features That Would Fit Well

- Adaptive difficulty - use UserPerformanceSummary to tweak timer/difficulty (high impact, data already exists)
- Character learn cards - short bio unlocked after completing a level
- Streaks and gentle achievements - pairs with local notification nudges
- Audio read-aloud (TTS) - helps younger kids without mic permissions
- Church/small-group leaderboards - join your church code
- Tamil - when church stakeholders are ready
- Admin PDF export - export_questions_pdf.py could become an admin button
- image_clue asset pipeline - admin upload + CDN when ready

5. Technical Cleanup

- Remove or archive orphaned Stained Glass code
- Align bundle ID across Android, iOS, and backend config
- Add basic mobile widget/integration tests
- Set production legal URLs in backend config
- Consider CI for backend tests + Flutter analyze

6. Recommended Priority Order

Now

- Finalize bundle ID, fix deploy scripts, device QA on phone + emulator

Before beta

- Legal docs, launch content (Track A), app icon/splash

Before store submit

- AdMob COPPA audit, Firebase/Crashlytics, store screenshots

Post-launch v1.1

- Adaptive difficulty, visual polish on other tabs, TTS, achievements

Bottom Line

The app works end-to-end as a prototype. To ship, you mainly need real content, legal sign-off, store assets, and device QA.

Highest-value engineering improvements: unify UI (Parchment across all tabs), use adaptive difficulty data already collected, and clean up bundle ID + dead code.

Generated from the Anointed spec pipeline and codebase review.
