

Anointed

Product Overview — Non-Technical Stakeholder Edition

Prepared by Architecture Agent • 1 September 2026 • Based on approved requirements

1. What Is Anointed?

Anointed is a Bible character quiz game for mobile phones and tablets (iPhone, iPad, Android). Players progress through a visual level map — think of it like a board-game path — unlocking levels by correctly answering questions about Bible characters. Rather than plain text flashcards or static Q&A screens, each level uses varied challenge formats: clues, image prompts, countdown timers, and progressively harder questions. The experience is designed to be genuinely fun and age-appropriate, not just a digital study worksheet.

The app is free to download from the Apple App Store and Google Play. The first 10 levels are always free. Players who want to continue through all 100 levels purchase a one-time unlock for approximately ₹100 through their phone's existing app store billing — no credit card forms, no account registration with a payment provider.

Who is it for?

Primarily the church community — from children aged 6–12 (the primary design audience) through to youth, adults, and elders. The interface is designed to be approachable for a child who just learned to read and legible for an elder using a larger-text option. A companion web-based admin tool is included for church staff to manage quiz content and view engagement reports.

2. Business Model & How Success Is Measured

Business model: Free download + optional one-time in-app purchase + non-intrusive advertising

Revenue streams

- **In-app purchase (~₹100):** A single, permanent level-unlock purchase. Once bought, levels 11–100 are unlocked forever on that account. No subscriptions, no recurring charges, no consumable currency. The purchase goes through Apple or Google's standard payment system — the app never handles card details directly.
- **Advertising:** Non-intrusive contextual/non-personalised ads displayed in ranked mode. Children under 13 see only non-targeted ads (required by child privacy regulations — see Section 5). Practice mode is entirely ad-free.

How success is measured

The primary 6-month success metric is **Daily Active Users (DAU)** — how many players open and play the app on any given day. No specific numeric target has been set by the team yet; the v1 launch is primarily a community deployment with organic growth from the church network.

Secondary indicators tracked from day one include: level completion rates (where do players get stuck?), IAP conversion (what percentage of free-tier completers buy the unlock?), ad impression volume, and leaderboard participation. All of this is visible in the admin dashboard.

3. What Is In v1 — and What Is Deliberately Left Out

Feature	v1 status	Notes
100 levels with varied challenge formats	✓ IN	~300 Bible characters, ~10 questions per level
Visual map progression	✓ IN	Game-style level map with unlock state

Feature	v1 status	Notes
Free tier (levels 1–10)	✓ IN	No purchase required to play the first 10 levels
One-time IAP level unlock (~₹100)	✓ IN	Via Apple/Google billing only — no external payment
Countdown timer (difficulty-scaled)	✓ IN	60s on easy levels, shorter on harder ones
Leaderboard (periodic sync)	✓ IN	Refreshes every few minutes — not live
Practice mode (offline, no ads)	✓ IN	Subset of questions, fully offline
Age gate + parental consent for under-13	✓ IN	Required for child privacy compliance
Account recovery via SMS OTP	✓ IN	Only triggered on new-device sign-in
In-app account deletion	✓ IN	Required by Apple App Store policy
Force-upgrade blocking screen	✓ IN	Prevents old app versions from connecting
Web admin dashboard	✓ IN	Content management + exportable reports
Tablet support with landscape orientation	✓ IN	iPhone/iPad + Android phones/tablets
Screen reader support (VoiceOver/TalkBack)	✓ IN	Accessibility for elders and visually impaired
Levels 101–300 (3,000+ characters)	X FUTURE	Planned for post-v1 versions

Feature	v1 status	Notes
Tamil language support	X FUTURE	Draft translations planned; church review required before publish
Google / Apple Sign-In (social login)	X FUTURE	Mobile number only for v1; both must be added together when implemented
Push notifications	X FUTURE	Not in v1
Deep linking	X FUTURE	Not in v1

4. Content: The Questions and Characters

The v1 game covers approximately **300 Bible characters** across 100 levels, with roughly 10 questions drawn from a pool of variants per level (so the same level plays slightly differently on each attempt — players can't memorise a fixed sequence). Difficulty increases level by level: the earlier levels ask about well-known characters with generous time limits; later levels introduce minor characters and cut the timer.

All quiz content is managed through the admin dashboard — church staff can add, edit, or review characters and questions without releasing a new app update. The app store submission includes whatever content is loaded at the time of launch; new characters can be added server-side afterwards.

Content gap to resolve before launch: The requirements do not yet specify who will author the initial 300-character English content base and the estimated ~1,000 question variants. This is the single largest pre-launch content risk. Assigning a content owner and establishing a review process should happen before the development sprint begins.

5. What "Apps Involving Minors" Means for This Specific Build

Anointed is classified in the requirements as an app involving minors — not because it is restricted to children, but because children as young as 6 are a primary audience and will actively use it. In practical terms, this shapes the product in four concrete ways that are already built into the v1 plan:

1. **Age gate at sign-up.** Every new user enters their age. Users under 13 cannot proceed without a recorded parental consent step. This is not optional — without it, the app cannot legally collect data from that child or serve them personalised features.
2. **Child-directed advertising.** For users under 13, the AdMob SDK is put into child-directed mode, which switches off behavioural targeting and personalised ad profiles. These users see only contextual (non-personalised) ads. This is non-negotiable regardless of the ad network chosen.
3. **Immediate data deletion.** When a user (or their parent) requests account deletion from within the app, all data is deleted immediately — not archived, not soft-deleted. This includes gameplay history, leaderboard entries, purchase records, and ad logs. An audit trail of the deletion event is retained for compliance purposes, but not the PII itself.
4. **Privacy Policy must cover children.** The app cannot be submitted to either app store without a published privacy policy that explicitly describes how children's data is collected, used, and deleted. This policy needs to be drafted and reviewed by legal counsel — it is flagged as "needs drafting" in the requirements and is the highest-priority non-technical task before launch.

Legal note: The specific regulations that apply — whether COPPA (USA), UK Age Appropriate Design Code, India's DPDPA, or others — depend on where users are located and how the app is distributed. The compliance architecture has been designed to meet a COPPA-level baseline, but applicability must be confirmed with a qualified legal professional before the app goes live. This document does not constitute legal advice.

6. Timeline & Practical Reality

The requirements set a **1-week target for v1**. This is aggressive for a full quiz game with IAP integration, leaderboard, offline mode, admin dashboard, age gate, and compliance-aware data flows. The architecture has been designed accordingly — a single monolithic backend (no complex microservices), managed hosting services (no infrastructure to provision), and a single codebase mobile app (Flutter). Every "fancy" feature that can be deferred to post-v1 has been deferred.

The most likely schedule risks are: (a) content authorship — getting 1,000+ question entries reviewed and loaded in time; (b) App Store review — Apple typically takes 1–3 business days but can take longer for apps involving minors; (c) legal documents — Privacy Policy and Terms of Service cannot be auto-generated and require human sign-off.

7. Approval Gate

This document, along with **architecture.html**, the UX/design specification, the analytics specification, and the QA test plan, forms the complete pre-implementation review package. **Nothing downstream (code generation, content loading, app store setup) should begin until all five documents have been reviewed and signed off by the project lead.**

When you are ready to proceed, the next agent in the pipeline is the **UX Design Agent**, which will produce the screen inventory, user flows, and design tokens derived from these requirements.

Anointed Product Overview • Architecture Agent output • 1 Sep 2026

This document was generated by an AI agent from the project requirements file. It must be reviewed by a human before any external commitments (legal, store, financial) are made based on its contents.
